Apple Mac Installation Notes

Login as **the System Administrator** to install the database on Mac OS X Servers.

To install the database on Mac OSX Client, login as a user with administrative privileges. After installing FileMaker Pro, you must give all users full read/write access to the FileMaker Pro 10 applications folder. By default, they will not have read/write access to the subfolders in the FileMaker Pro 10 directory. It has been discovered that some Mac OSX users may be experiencing difficulties accessing the database system or functions. This is due to the fact that although the Mac OSX system is saying that the "Database" folder, the "Documents" folder, and the local "FileMaker Pro 10" folder, and all their respective subfolders, have been configured to enable all users read/write access, that this is not the case. You need to use the tool described in Tech Bulletin 060206 to correct the problem.

Make certain you have the latest version of Java Runtime Engine (JRE) installed.
