## Client Server Diagram (4 or more Clients)

You have a server that all users can connect to on your Local Area Network (LAN) and have purchased the FileMaker Server software.

- You will perform a server install, installing the FileMaker Server V10 software (if not already installed), and the databases on to the server.
- In addition, you should install the database Documents on to a file server that all users will have access to.
- Every client will need to have FileMaker Pro V10 client software installed (if not already installed), and all FileMaker Pro Plug-ins required for the database.
- All users on your LAN will connect to the database software hosted by the FileMaker Server, and the database will always be running and available to all network users.

**The Client-Server Network Model**
