Developer of  
ExhibitOffice + ManagEvent

## Small Installation 3 or less Clients, (peer to peer)

You do not have a server on your Local Area Network or have not purchased FileMaker Server v10 software. You will be performing a Peer-to-Peer installation that means one client workstation will be hosting the Database and all other users will be connecting to it via your LAN.

- You will be installing FileMaker Pro v10 client software (if not already installed) and the FileMaker Pro Plug-ins on all machines.
- On the Peer-to-Peer Host, or a file server that all users will have access to, you will be installing the Database and Documents.

Special considerations include:

- You must start the Host everyday and completely login to the database before other users can access it from their workstations.
- You are responsible for manually stopping the Host and backing up all the files in the database folder.

### The Peer-To-Peer Network Model
